**Subject:** Retain ICC's Governmental Consensus Voting Process

The current governmental consensus voting process for developing building codes has worked well and has contributed to improvements in energy efficiency. I look forward to the publication of the 2021 IECC.

I oppose changing the process for developing the IECC that the ICC has used. Allowing broad participation in developing the codes by government officials who rely on it to develop their own codes has proved beneficial for both new and innovative initiatives and for broad acceptance of the IECC. Centralizing the responsibility for developing the IECC with a small group would be detrimental.
